

With the Process Plugins™ Condenser Condition Monitor, the water-cooled condenser is modeled to predict pressure, temperature difference (TTD), and cleanliness. These parameters are compared real-time to the corresponding actual conditions which are also calculated. Differences in expected results could indicate problems with condenser operation or physical condition, which often has a substantial impact on plant heat rate.

The complete documentation of the Process Plugins™ Condenser Condition Monitor is currently under development and will be completed in the near future. If you have an immediate need for a detailed description or need to know the status of testing and availability of any of the Process Plugins™ Solutions, please contact us by one of the methods below. Thank you for your interest in the Process Plugins™ Solutions.
